Procta

Investment Requirement & Cost Breakdown

18-month capital plan covering one-time setup, annual renewals, monthly operating costs, and a transparent accounting of what falls outside this budget.

Issued: 30 May 2026

All figures in Indian Rupees (Rs.). USD conversions use USD 1 = Rs. 95 for the foreign-billed line items (Apple Developer Program, Windows code-signing). Conversion drift of plus or minus 5 percent is within the rounding tolerance of this document.

1. Headline Numbers

Procta requires capital across three buckets: one-time setup (hardware, tools, prepaid hosting), annual recurring (developer program renewals), and monthly operating costs. The 18-month ask is presented in two scenarios so the reader can match the number to the level of go-to-market activity being funded.

Scenario	18-month capital requirement
A. Lean — current burn, no marketing spend live	**Rs.1,71,950**
B. Ramped — production email + Vercel Pro + Rs. 10,000 / mo marketing	**Rs.3,87,950**

Recommended pitch number: **Rs.3,87,950 (approximately Rs. 4 lakh)** for the 18-month ramped sprint with a real paid acquisition channel running. The lean figure Rs.1,71,950 represents the operating minimum that keeps the platform live without marketing spend.

2. One-Time Setup

Items paid once at the start of the 18-month plan. Hosting and domain are prepaid two years so neither expires inside the planning window.

Item	Cost (Rs.)
Development tools (IDEs, design assets, productivity SaaS, license fees)	Rs.21,000
Hostinger KVM server, 16 GB, two-year prepay	Rs.28,000
Domain registration, two-year prepay	Rs.1,600
Subtotal	**Rs.50,600**

3. Annual Recurring

Apple Developer Program renewal is annual, not one-time. Across the 18-month window it is paid 1.5 times (year one upfront, year two prorated for six months).

Item	Cost (Rs.)
Apple Developer Program (USD 99 / year)	Rs.9,500
Annual subtotal	**Rs.9,500**

Prorated across 18 months: **Rs.14,250** (1.5 years times Rs. 9,500).

4. Monthly Operating Costs

Current state — actively billing today

What hits the bank account every month at the current scale of operations. Marketing and production email tiers are not yet activated, so they do not appear here.

Item	Cost (Rs.)
AI / development tool subscriptions (Claude, Cursor, GitHub Copilot)	Rs.5,000
Windows app signing service (USD 10 / month, Azure Trusted Signing)	Rs.950
Current monthly burn	**Rs.5,950**

Additional — activated when ready to scale

Two line items intentionally held off until the product is ready for a paid acquisition push. Email and Vercel upgrades are gated on hitting the volume that needs them; the marketing budget is gated on having sufficient capital raised to commit to it for at least six months.

Item	Cost (Rs.)
Email / SMS / Vercel Pro upgrades	Rs.2,000
Sales and promotion budget (Meta + Google Ads + content)	Rs.10,000
Additional when scaling	**Rs.12,000**

Combined — fully ramped monthly burn

Rs.17,950 per month when both current line items and the scale-up items are active. This is the figure used in the Scenario B runway calculation.

5. 18-Month Runway Calculation

Both scenarios use identical one-time and annual-recurring components. The only variable is whether the monthly burn includes the scale-up line items (Email / Vercel Pro / marketing budget).

Scenario A — Lean (no marketing spend live)

Item	Cost (Rs.)
Current monthly burn x 18 (Rs. 5,950 x 18)	Rs.1,07,100
Apple Developer Program (1.5 years x Rs. 9,500)	Rs.14,250
One-time setup	Rs.50,600
Total capital required (Scenario A)	**Rs.1,71,950**

Captures what is needed to keep the platform operating for 18 months at the current scale. No paid acquisition, no production email tier. Suitable for a survival floor.

Scenario B — Ramped (marketing channel live)

Item	Cost (Rs.)
Ramped monthly burn x 18 (Rs. 17,950 x 18)	Rs.3,23,100
Apple Developer Program (1.5 years x Rs. 9,500)	Rs.14,250
One-time setup	Rs.50,600
Total capital required (Scenario B)	**Rs.3,87,950**

Funds 18 months of operations with the Email / Vercel Pro tier active and a Rs. 10,000 / month performance marketing channel running for the full window. This is the recommended ask.

6. What Is Not in This Budget

Items intentionally excluded so a sophisticated reader trusts the rest of the document. Each one is either deferred to a later stage, revenue-funded once a paying customer is on board, or out of scope because it is a personal cost rather than an operating cost.

Windows Organisation Validation (OV) code-signing certificate

A separate Sectigo or Certum OV certificate runs Rs. 15,000 to Rs. 20,000 per year. The Azure Trusted Signing line item (Rs. 950 / month) covers the cheaper Microsoft first-party path. A standalone OV certificate is a Year 2 decision; not budgeted here.

Razorpay payout fees

Approximately 2 percent per UPI Autopay collection. This is deducted from revenue at payout time, not an operating cost the company pays out of capital. Excluded from the burn.

Accounting and GST filing

Roughly Rs. 2,500 per month if outsourced to a CA. Deferred until invoices begin going out. No revenue today means no GST liability today; this becomes a real line item the month billing turns on.

Hostinger renewal in Year 3

The server is prepaid two years, so it falls outside the 18-month window. The next renewal at the prevailing rate (approximately Rs. 14,000 / year) is a future-period item.

Founder living expenses and opportunity cost

Explicitly omitted. This document captures the operating cost of running Procta as a company; founder compensation is a personal financial decision and is not part of the capital ask.

Hindi keyword model improvements and additional regional language coverage

Vosk en-IN and hi-IN models are downloaded at first run without a per-seat license fee. Additional Indian-language coverage (Tamil, Telugu, Marathi, Bengali) would add approximately Rs. 0 / month direct cost (models are Apache 2.0 licensed) but would require engineering time.

Customer support headcount

Founder-handled today. Once the customer base requires dedicated support coverage, a part-time hire would add approximately Rs. 15,000 to Rs. 25,000 / month. Trigger point: more than 30 active institutions.

7. Use of Funds (Scenario B)

How the recommended ask breaks down by spend category over the 18-month window.

Category	Amount (Rs.)	Notes
Performance marketing (Meta + Google Ads + content)	Rs.1,80,000	Rs. 10,000 / month x 18
Hosting and infrastructure	Rs.28,000	2-year prepay, server amortised
Developer tools and software	Rs.90,000	Rs. 5,000 / month x 18
Operations (email, Vercel Pro, signing services)	Rs.53,100	Email + Vercel + Windows signing
Code-signing and developer programs	Rs.23,750	Apple 1.5 yr + Windows signing
Setup and procurement	Rs.13,100	Tools + domain + buffer
Total	**Rs.3,87,950**	

8. Notes for the Reader

This document captures the operating cost of running Procta as a company through an 18-month sprint. It does not project revenue, customer-acquisition cost, or unit economics; those live in a separate model. The question this document answers is narrow: how much capital is required to keep the company operating and the marketing channel running for 18 months.

Revenue projections, conversion modelling, and the path to self-funded operations are addressed in companion documents (Procta_Features.pdf for product surface, Procta_Competitive_Comparison_Report.pdf for the market landscape).

Document generated on 30 May 2026 by scripts/gen_investment_pdf.py. Re-run the script after any change to monthly burn or one-time setup to refresh all derived totals.
